

Vantage reporting 2.3

Vantage reporting 2.3 is a web-based centralised reporting system that allows IT managers or channel managed service partners to log and analyse the company's security in a distributed network. Version 2.3 is compatible with Zyxel's current Zywall 5, 35 and 70.

With the benefit of detailed real-time and historical reports in the format of graphs, IT

managers can clearly see any possible security threats. In addition, remote management is supported to allow access from any location using a standard web browser. This gives IT managers the opportunity to outsource this service and receive daily and weekly reports, thus easing their workload.

One key feature of the Vantage software is the intuitive drill-down function, as it notifies IT managers immediately of any suspicious activity and allows them to

configure their firewall to block such threats. An added benefit to Vantage is that the company is able to monitor staff's online activity. If it is found that employees are spending too much time on unrelated work or blacklisted sites, the firewall can be configured to block employees from visiting them.
